FAST BOWLER VIDEO ANALYSIS

Back View + Side View | Observations, Correct Position, Injury Risk & Coach Feedback

---

MASTER TECHNICAL & BIOMECHANICAL TABLE

Category	Back View – What We Observe	Side View – What We Observe	Correct / Optimal Position	What Leads to Injury Risk	Coach → Player Feedback (Linked)
Run-up Line	Straight vs drifting approach	Momentum into crease	Straight, repeatable run-up	Lateral drift → back & hip stress	*"When you drift sideways late, your body compensates later. Keep your last 5–6 steps straight into the crease."*
Run-up Rhythm	Step consistency	Acceleration pattern	Smooth build-up, no braking	Deceleration → lumbar overload	*"Stay smooth right through the crease — braking costs pace and loads your back."*
Pre-delivery Jump Direction	Sideways drift	Vertical vs horizontal jump	Low, forward-directed jump	Excess vertical jump → spinal load	*"Think forward, not upward. A flatter jump protects your back and keeps pace efficient."*
Jump Balance	Shoulder alignment	Head & torso control	Balanced, upright jump	Off-balance landing → ankle/knee risk	*"Stay stacked in the air so you land strong and controlled."*
Back Foot Contact (BFC) Angle	Open / closed foot	Landing timing	Slightly open or parallel	Closed BFC → counter-rotation	*"That closed back foot twists your back — let it open slightly to rotate freely."*
BFC Stability	Hip collapse	Trunk posture	Stable hips, tall trunk	Hip drop → groin & back stress	*"Hold your shape on the back foot — collapsing costs control and health."*
Hip–Shoulder Alignment	Mixed action cues	Sequencing start	Hips lead, shoulders delayed	Mixed action → lumbar injury	*"Let the hips go first, then the shoulders follow"*

Category	Back View – What We Observe	Side View – What We Observe	Correct / Optimal Position	What Leads to Injury Risk	Coach → Player Feedback (Linked)
Delivery Stride Direction	Crossing / straight	Stride length	Straight, consistent stride	Crossing stride → knee stress	*“Land straight under your body to stay strong through the front leg.”*
Stride Length	Lateral consistency	Over / under stride	Optimal, repeatable	Overstride → front knee & back	*“Overstriding feels powerful but overloads your knee — let’s shorten it slightly.”*
Front Foot Contact (FFC) Line	Straight vs cross-over	Landing timing	Straight, under hip	Cross-over → ankle & knee load	*“Keep the front foot straight — crossing forces your knee to absorb rotation.”*
Front Leg Bracing	—	Knee flexion/extension	Slight bend → firm brace	Collapse → lumbar stress	*“Brace the front leg before release — that gives pace without extra effort.”*
Hip Rotation Timing	Alignment at FFC	Rotation order	Hips before trunk	Late hips → shoulder stress	*“Fire the hips first — it takes pressure off your shoulder.”*
Trunk Flexion	Side lean	Forward bend timing	Controlled forward flexion	Excess flexion → disc load	*“Stay tall longer; bend forward only as you release.”*
Lateral Trunk Lean	Falling away	—	Minimal side bend	Side lean → stress fractures	*“Falling away puts side-load on your spine — finish taller.”*
Head Position	Falling across	Vertical stability	Head over front knee	Head drift → back compensation	*“Keep your head stacked — accuracy and spinal safety improve instantly.”*
Bowling Arm Path	Arm alignment	Arc & speed	Clean vertical arc	Looping → shoulder overload	*“A straighter arm path protects your shoulder and improves seam.”*

Category	Back View – What We Observe	Side View – What We Observe	Correct / Optimal Position	What Leads to Injury Risk	Coach → Player Feedback (Linked)
Arm Slot Consistency	Release channel	Arm height	Same slot each ball	Slot change → elbow stress	*“Changing slot under effort loads your arm — trust one slot.”*
Non-Bowling Arm	Direction of pull	Timing of block	Strong, straight pull-down	Early collapse → shoulder stress	*“Hold the front arm longer — it connects your whole body.”*
Chest Rotation	Alignment at release	Opening timing	Opens after FFC	Early opening → lumbar twist	*“Delay chest opening to avoid twisting your lower back.”*
Release Point (Lateral)	Wide vs close	—	Repeatable channel	Wide drift → shoulder load	*“Let’s lock in one release channel — drifting stresses the shoulder.”*
Release Point (Vertical)	—	Height consistency	Stable release height	Fluctuation → back strain	*“When your height changes, your back pays the price.”*
Wrist Position	Seam cues	Pronation timing	Firm wrist, late pronation	Early break → elbow stress	*“Hold the wrist firm just a fraction longer.”*
Seam Stability	Wobble	—	Stable seam	Instability → forearm overload	*“A stable seam means less strain and better movement.”*
Follow-through Direction	Straight vs falling away	Momentum flow	Straight down pitch	Falling away → lumbar compression	*“Finish straight — let the forces run out safely.”*
Deceleration Pattern	Balance	Sudden stop	Smooth deceleration	Abrupt stop → spine/knee injury	*“Don’t block the action — let your body slow naturally.”*
Back Leg Swing	—	Swing-through freedom	Free, relaxed swing	Restricted swing → hamstring risk	*“Let the back leg come through — it unloads the body.”*

Category	Back View – What We Observe	Side View – What We Observe	Correct / Optimal Position	What Leads to Injury Risk	Coach → Player Feedback (Linked)
Counter-rotation	Visible twist	—	Minimal counter-rotation	Stress fractures	*“Twisting against yourself is the biggest red flag — we’ll clean that up.”*
Repeatability (Fatigue)	Channel drift	Timing breakdown	Same action under fatigue	Fatigue breakdown → overuse injury	*“The goal is the same action on ball 1 and ball 60.”*
