

FAST BOWLERS – BIOMECHANICAL CORRECTION CUES

1. Hip–shoulder separation peaks too early

Correction Cue:

“Delay your trunk rotation by keeping your shoulders closed for 2–3 frames longer after FFC; let the hips lead first, then the shoulders accelerate past them.”

2. Pelvis rotates faster than the trunk

Correction Cue:

“Activate stronger trunk acceleration by pulling the non-bowling arm down earlier and tightening your core so the shoulders ‘chase’ the hips.”

3. Front-leg bracing occurs after release

Correction Cue:

“Land with a slightly bent knee and snap it straight *before* release — think of ‘hitting the wall’ with your front leg.”

4. Back-foot impact angle is too steep

Correction Cue:

“Focus on landing flatter and more heel-to-toe on BFC to convert more horizontal energy into the delivery stride.”

5. Center of mass stays behind front foot

Correction Cue:

“Drive your hips forward aggressively during the last stride to bring your body mass over the front leg at release.”

6. Too much vertical force in jump

Correction Cue:

“Reduce jump height; aim to ‘skim forward, not upward’ with a flatter pre-delivery jump.”

7. Trunk flexion timing is early

Correction Cue:

“Stay tall through BFC → initiate trunk flexion only as the arm enters the downswing.”

8. Bowling arm reaches max speed late**Correction Cue:**

“Start your arm downswing earlier by synchronizing it with hip rotation instead of waiting for trunk flexion.”

9. Non-bowling arm pull not synchronized**Correction Cue:**

“Begin the front-arm block the moment your hips start to open — this links lower-body and upper-body rotation.”

10. Micro-pause in bowling arm path**Correction Cue:**

“Maintain continuous acceleration by pulling the non-bowling arm more forcefully to remove braking forces in the torso.”

11. Excessive lateral braking in follow-through**Correction Cue:**

“Drive straight through the crease with your hips and keep the chest facing the target slightly longer.”

12. Back foot too close to midline**Correction Cue:**

“Land the back foot 3–5 cm wider to reduce counter-rotation and lower lumbar stress.”

13. Delayed ankle eversion in front leg**Correction Cue:**

“Activate the ankle earlier by pushing the inside edge of the foot into the ground at FFC.”

14. Slow knee extension in front leg

Correction Cue:

“Snap the knee straight immediately on landing — imagine firing the leg into the ground.”

15. Hand passes too close to body in downswing

Correction Cue:

“Open your shoulder line slightly earlier to keep the hand path outside the hip and enable whip.”

16. Seam stability drops at final 5% of release

Correction Cue:

“Keep the wrist locked and firm for one extra frame before pronation begins.”

17. Chest stays closed at release

Correction Cue:

“Rotate your chest fully toward the batter during trunk flexion to lengthen the delivery arc.”

18. Head decelerates before arm finishes

Correction Cue:

“Keep your eyes fixed on the target until the bowling hand has fully completed its follow-through.”

19. Arm slot changes with stride length

Correction Cue:

“Standardize the last stride by shortening it 3–4 cm; match lower-body rhythm to your preferred arm slot.”

20. Shoulder tilt angle inconsistent

Correction Cue:

“Maintain a stable shoulder tilt from FFC to release by engaging your lateral trunk muscles.”

21. Arm–trunk angle opens too early**Correction Cue:**

“Hold the bowling arm slightly closer to your body in the downswing and let the trunk lead the extension.”

22. Too much rotational force, not enough linear force**Correction Cue:**

“Drive your front hip and chest more forward — think ‘towards the batter’, not just ‘around’.”

23. Pelvis tilts excessively during pre-delivery jump**Correction Cue:**

“Keep your hips level in the air by engaging your glutes and avoiding sideways drift.”

24. Weak back-leg push-off impulse**Correction Cue:**

“Push harder off the back leg by extending the hip explosively — imagine you’re jumping forward off a starting block.”

25. Stride length increases under fatigue**Correction Cue:**

“Set a fixed stride length target and shorten the last three steps slightly when tired to maintain rhythm.”

26. Delay between FFC and shoulder rotation**Correction Cue:**

“Start rotating your trunk as soon as the front foot plants — the moment the heel hits, the shoulders must follow.”

27. Spine angle too rigid at release

Correction Cue:

“Allow slight elastic flexion-extension in your torso to improve rotational recoil and energy transfer.”

28. Late arm block causing wide release under pressure

Correction Cue:

“Set the non-bowling arm earlier, keep it high, and pull it down sooner to stabilize the chest angle.”

29. Arm speed high but trunk speed lagging

Correction Cue:

“Accelerate your trunk earlier by engaging the obliques and serratus muscles during hip rotation.”

30. Wrist not pronating fully

Correction Cue:

“Finish with your thumb pointing toward the ground — exaggerate the pronation to improve late swing.”
