

FAST BOWLERS – COACHING TIPS

RUN-UP & APPROACH

1. “Your run-up line is drifting slightly to the leg side—keeping it straighter will improve energy transfer into the crease.”
2. “You are decelerating in the final two strides; try to maintain momentum up to front-foot contact.”
3. “Your rhythm in the last five steps looks inconsistent; tightening that sequence will give you better repeatability.”
4. “You’re entering the crease slightly wide, which is affecting your natural angle—try to approach more directly toward your target.”
5. “Your stride pattern is changing between deliveries; focus on a consistent cadence into the crease.”

GATHER & PRE-DELIVERY JUMP

6. “Your pre-delivery jump is drifting sideways, causing alignment issues—stay more upright in the air.”
7. “The jump height is too high, which is wasting vertical energy; aim for a flatter jump to keep momentum forward.”
8. “You’re landing from the jump slightly off-balance; a more controlled gather will help stability at BFC.”
9. “Your shoulders are opening too early during the jump—keep them aligned until BFC.”
10. “Your head position in the jump drops sharply; try to stabilize it to maintain a consistent release point.”

BACK FOOT CONTACT (BFC)

11. “Your back foot is landing too closed, restricting hip rotation—open it slightly for smoother sequencing.”
12. “Your back foot is pointing too far towards fine leg; adjust it to improve alignment towards the target.”
13. “You’re collapsing your hips immediately at BFC; keep them level to generate more controlled rotation.”
14. “Your torso is leaning backward at BFC; staying tall will help you load more effectively.”

15. “Your shoulder alignment at BFC is crossing your body—try to keep them square to the target line.”

FRONT FOOT CONTACT (FFC)

16. “Your front foot is crossing over excessively, which is forcing your release point wide—land straighter for better control.”
17. “Your front leg is collapsing at the knee; work on bracing it sooner to create more pace.”
18. “Your head is falling to the off-side at FFC; keep it more central to maintain a straight action.”
19. “The timing of your front-foot plant is late, causing your upper body to rush—aim for an earlier, firmer landing.”
20. “Your front foot is landing too wide of your body; narrowing it slightly will improve stability and alignment.”

ALIGNMENT & SEQUENCING

21. “Your hips are opening before your front foot lands; delay rotation to maximize torque.”
22. “Your shoulders are rotating ahead of your hips; reverse that sequence to increase kinetic chain efficiency.”
23. “Your trunk is leaning too much towards the off-side, which is pulling your arm path away from the stumps.”
24. “You’re falling away to the leg side at release; try to stay taller and more upright for better control.”
25. “Your alignment after FFC is inconsistent—focus on driving straight down the pitch through the follow-through.”

BOWLING ARM MECHANICS

26. “Your bowling arm is drifting behind your head; bring it slightly around to maintain a clean vertical plane.”
27. “Your release height is dropping under pressure; stay tall and finish your arm action high.”
28. “Your arm path is too round-arm for your intended length—work on a straighter arc for better seam position.”
29. “Your arm speed is slowing at release; attack the point of release with more intent.”

30. “Your wrist is breaking early in the action—keep it firm until the ball leaves your fingers.”

NON-BOWLING ARM MECHANICS

31. “Your non-bowling arm is collapsing early; hold it longer to create more leverage in your rotation.”
32. “Your front arm pull is happening too wide—pull it straight down for more power.”
33. “Your non-bowling arm is not contributing to alignment; use it to guide your upper body toward the target.”
34. “Your front-arm pull is late; initiate it slightly earlier to synchronize with hip rotation.”
35. “You’re not completing your front-arm block; finish the pull to generate extra snap in the bowling arm.”

RELEASE POINT

36. “Your release point is varying too much laterally; aim to release from the same channel consistently.”
37. “You’re releasing the ball slightly behind your body—try to get the ball out slightly ahead of your front foot.”
38. “Your seam is wobbling at release; work on a more stable wrist position.”
39. “Your release height is fluctuating due to trunk flexion changes—keep your body posture consistent.”
40. “You’re releasing from too wide of the crease—experiment with coming closer to create more challenge for the batter.”

BALL ANGLE & SKILL EXECUTION

41. “Your outswing ball starts too straight; start it wider to allow it space to move.”
42. “Your inswinger’s wrist position isn’t fully closed; angle the seam slightly more toward fine leg.”
43. “Your bouncer release is too upright; drop your length with a slightly shorter release point.”
44. “Your yorker release is too high—bring the release point slightly lower for better execution.”
45. “Your slower ball cue is visible in your gather—keep your action identical until release.”

FOLLOW-THROUGH

46. "Your follow-through is cutting off early; drive your body forward to complete the action fully."
47. "You're stopping too abruptly after release; allow your momentum to flow naturally to reduce back strain."
48. "Your landing after release is unstable; work on a balanced, straight-line follow-through."
49. "Your head is turning away quickly after release; keep your eyes on the target a fraction longer."
50. "You're finishing too far to the off-side; aim to follow-through more towards the batter to improve accuracy."
